

QUALITY  
CRAFTSMANSHIP  
RELIABILITY

---

The fasteners used on this unit have been specialty coated with **Zinc Plus®**, a finish designed to provide years of rust and corrosion protection. However, certain precautions must be taken when cleaning these fasteners as abrasive chemicals and solvents will remove the protective finish.

Solvents will dissolve polymer coatings and the abrasive nature of phosphates will wear away the plating.

A non-solvent, non-phosphate cleaning solution should be used.

It is recommended that the following solvents **NOT** be used to clean plated fasteners: toluene, butoxyethanol, any lacquer thinner or solvent.

It is recommended that the following abrasive chemicals **NOT** be used to clean plated fasteners: methyl ethylketone, isobutene caustic, and phosphate containing cleaner, and methol acetone.

***WARNING - SOLVENT AND PHOSPHATE CLEANING CHEMICALS MAY REMOVE PLATING.***

The metal finisher is not responsible for any damage to fasteners due to improper use of cleaning chemicals.
